

VAULTQUEST

A room-by-room treasure hunt where quizzes, dares and clever hints unlock the next door

Game Concept Document - Week 1 Task: Game Concept Brainstorming & Documentation
Includes: overview, storyline, characters, core mechanics, market and competitive analysis, production plan

8. Conclusion and Next Steps 15

Executive summary. VaultQuest is a single-player and team game for students, in which the player enters a themed room, searches it, and must complete five tasks (quizzes and dares) to unlock the next room. Each task earns a clue shard and rewards (gold, battle points and gaming equipment). When all five tasks are done, the shards form a map to the room's hidden treasure chest, but the room's friendly-scary ghost, the Husher, then wakes up: the player must find the treasure quietly, hiding or running if the ghost hears a noise. Rooms get steadily harder, from a gentle Pirate Cove to a demanding Grand Vault, and the ghost gets faster and more alert. Hints are part of the game: players can buy or earn them to get unstuck. All rewards belong to one account and cannot be shared, traded or sold, which keeps play fair and safe for young players. The game supports solo play, squads of 2-5, a teacher-run class mode, and an optional battle arena. It sits between quiz platforms such as Kahoot and role-playing learning games such as Prodigy, adding a real exploration and treasure-hunt layer (section 6).

1. Game Overview

1.1 High concept

"Every room hides a treasure. Every task is a key."

VaultQuest turns studying into an adventure. The player is a Seeker exploring the Vault, a huge house of themed rooms built by an eccentric inventor. Each room is a hand-illustrated scene full of objects to inspect. Hidden among them are five Locks, which are tasks such as a quiz question or a short dare. Solving a Lock rewards the player and reveals a piece of a treasure map. Once all five Locks are solved, the map shows where the room's treasure chest is hidden, and the room's ghost, the Husher, wakes up. The player must sneak to the chest without making noise. If the ghost hears them, they must hide or run. Opening the chest unlocks the door to a harder room.

Elevator pitch. A mix of an escape room, a treasure hunt, a quiz show and a gentle stealth game, designed so that students can play alone or as a team, and teachers can use it in class. The difficulty grows room by room, so the game never gets stuck on one level of challenge.

1.2 Quick facts

Item	Detail
Working title	VaultQuest (final name to be checked for availability)
Genre	Educational adventure / puzzle-quiz game with a treasure-hunt structure
Target players	Students, ages 9-14 (grades 4-9) as the first audience; teachers and parents as secondary users
Platforms (target)	Mobile (Android and iOS) and web browser; school computers through the browser
Modes	Solo, Squad (2-5 players), Class Mode, optional Battle Arena
Villain	One Husher (friendly-scary ghost or goblin) per room; stealth during the treasure hunt
Structure	6 rooms at launch; 5 Locks per room (30 Locks) plus a treasure hunt in each room
Session length	One room takes about 10-15 minutes, which suits a school period or a short home session
Rewards	Gold, Battle Points (BP) and Gear; all bound to the player's account
Business model	Free for students; school licences for the teacher dashboard; optional cosmetics. No loot boxes.

1.3 Design pillars

Pillar	What it means in practice
Every room is a hunt	Players search and inspect, not just answer questions. Treasure-finding is a mechanic, not only a reward.
Easy to start, harder to master	Early questions are easy for the chosen grade band. Difficulty rises gradually through room theme, time and search complexity.
Hints are part of the game	Hints are clearly priced and fair, so a stuck player keeps moving instead of quitting.
Quiet courage	The treasure hunt is a stealth challenge: stay quiet, hide, or run. Tension comes from a friendly-scary ghost, never from gore.
Rewards are yours alone	Gold, BP and Gear can never be shared, traded or sold. This protects fairness and keeps young players safe.

1.4 Unique selling points

- **Learning inside a treasure hunt.** Most quiz games are a list of questions. VaultQuest wraps tasks in a room the player explores, so the questions have a place and a purpose.
- **Quizzes and dares together.** The mix of knowledge questions and light in-game challenges keeps play varied and works well for teams.
- **A villain that teaches calm focus.** The Husher turns the final search into a quiet, tense stealth moment that no quiz platform offers, while the learning happens in the calm Lock phase.

- **Hints as clues.** A hint ladder (Nudge, Clue, Reveal) helps with both tasks and treasure location, and it ties into the gold economy.
- **Solo, squad or classroom.** One game, four ways to play, with a teacher mode for subject and difficulty control.
- **Account-bound rewards.** No trading means no cheating, no real-money markets and fewer safety concerns for children.

2. World and Narrative

2.1 Setting and backstory

Long ago, Professor Ambrose Quill, a famous inventor who loved riddles more than anything, built the **Vault**: a sprawling house of themed rooms, each sealed by five magical Locks. Instead of keeping his greatest treasure in a safe, he hid it at the very end and wrote that only a curious mind could open the way. The Professor loved silence while he thought, so he also trained a ghost to guard each treasure. These are the **Hushers**: ghosts who are not truly evil, but who cannot stand noise. After he disappeared, the Vault was forgotten and the Hushers kept guarding their rooms.

Every year the Vault opens its doors to a new group of young adventurers called **Seekers**. The player is one of them. Their guide is **Pip**, a small robot owl built by the Professor to help Seekers who get stuck.

2.2 Storyline

The story is light, funny and told in short scenes between rooms, so it never slows the learning. It follows the Seeker's journey through the six rooms.

Stage	Rooms	What happens
Beginning	1 Pirate Cove	Pip welcomes the Seeker and explains that each room has five Locks and one treasure. The first treasure is a pirate's chest of toy gold, and the Professor's first note appears: "Curious minds open doors."
Rising action	2 Haunted Library, 3 Jungle Temple, 4 Clockwork Lab	Each room has its own Husher, a ghost with a quirky look who wakes when the treasure map is complete. Grimble, the keyholder goblin, begins to follow the Seeker, sometimes helping and sometimes stealing a shard to slow them down.
Twist	5 Frozen Observatory	The Seeker learns that Grimble was the Professor's first apprentice, who was left behind when the Vault closed. He has guarded the rooms hoping someone would finally reach the end.
Climax	6 The Grand Vault	All earlier skills are tested in a mixed-subject room. The Seeker must sneak past the fastest, most alert Husher of all, with Grimble's help, to open the last chest.
Ending	Final reveal	The Grand Treasure is a book of the Seeker's own journey, with every question they solved, plus the Professor's message: "The real treasure is what you learned on the way." The Hushers finally rest because the Vault is quiet, and new rooms open for the next season.

2.3 Themes and tone

The main themes are curiosity, persistence and teamwork. The tone is warm, playful and encouraging. Wrong answers never produce punishment or mockery; Pip responds with a gentle explanation and another chance. The writing uses short sentences and a reading level suitable for upper-primary and middle-school students.

Figure 1 - World path and difficulty curve across the six rooms

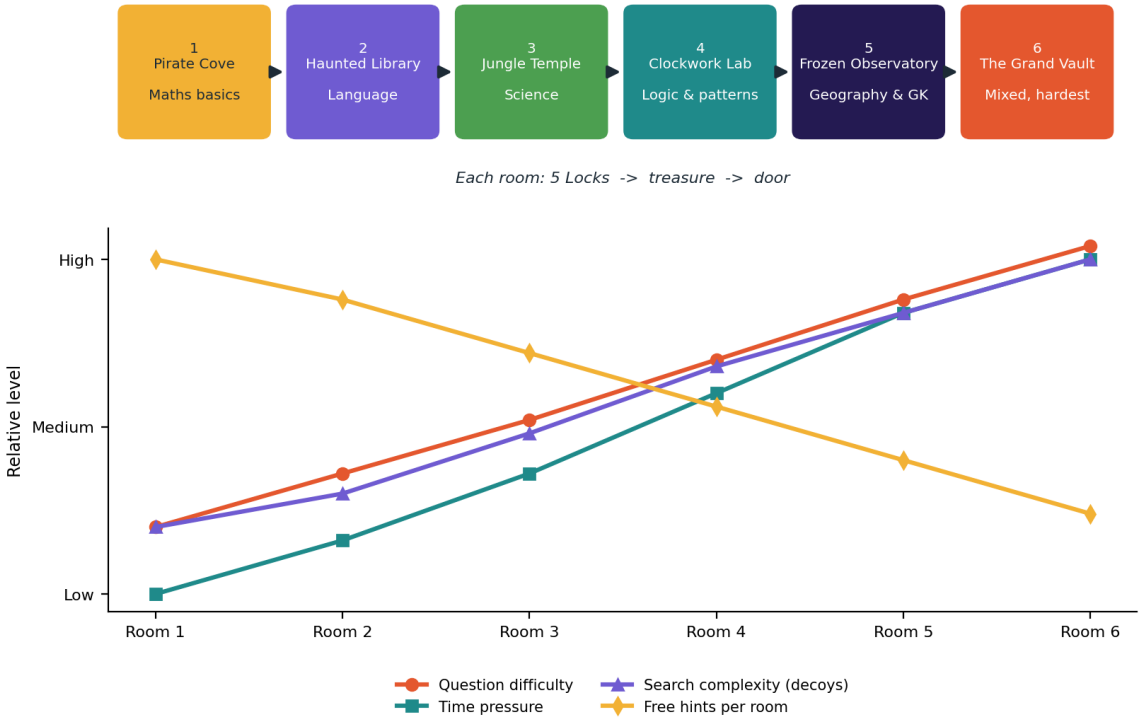

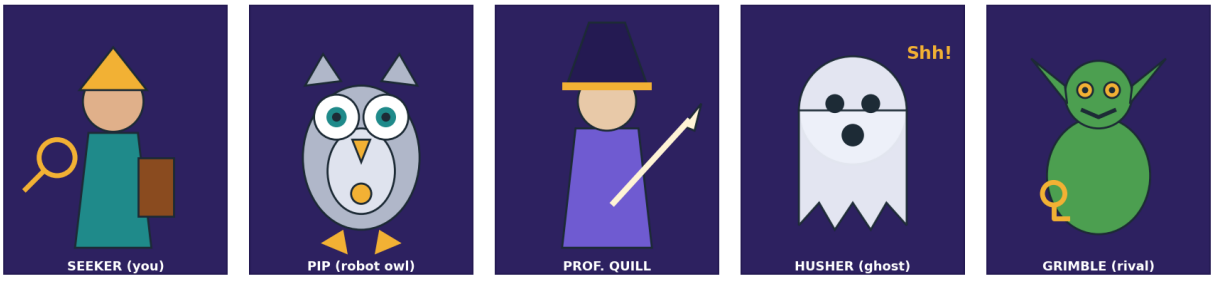

Figure 1 shows the six rooms in order and how difficulty rises. Each room has its own subject focus, but later rooms revisit earlier topics so that learning is repeated naturally.

3. Characters

Figure 2 - Character concept sketches (silhouette level, not final art)

Character	Role and look	Personality and arc	Gameplay function
The Seeker (player avatar)	Young explorer with a backpack and a magnifying lens. Players customise face, outfit and backpack with cosmetics earned from gold.	Silent but expressive. Starts unsure and ends as a confident explorer, shown through small animation changes as stars are collected.	The player. Searches rooms, solves Locks, opens chests.
Pip, the robot owl	Small silver owl with big teal eyes and gold feet, who perches on the Seeker's shoulder.	Cheerful, a little nervous, loves jokes. Learns to trust the Seeker's judgment as they progress.	Guide and hint system. The Nudge, Clue and Reveal hints are delivered by Pip, so help feels friendly, not like a penalty.
Professor Quill	Tall inventor in a purple coat and tall hat, seen only in notes, portraits and recordings.	Playful and wise. His notes at each room's end carry the central message about curiosity.	Narrative frame. Delivers the story and the final reveal.

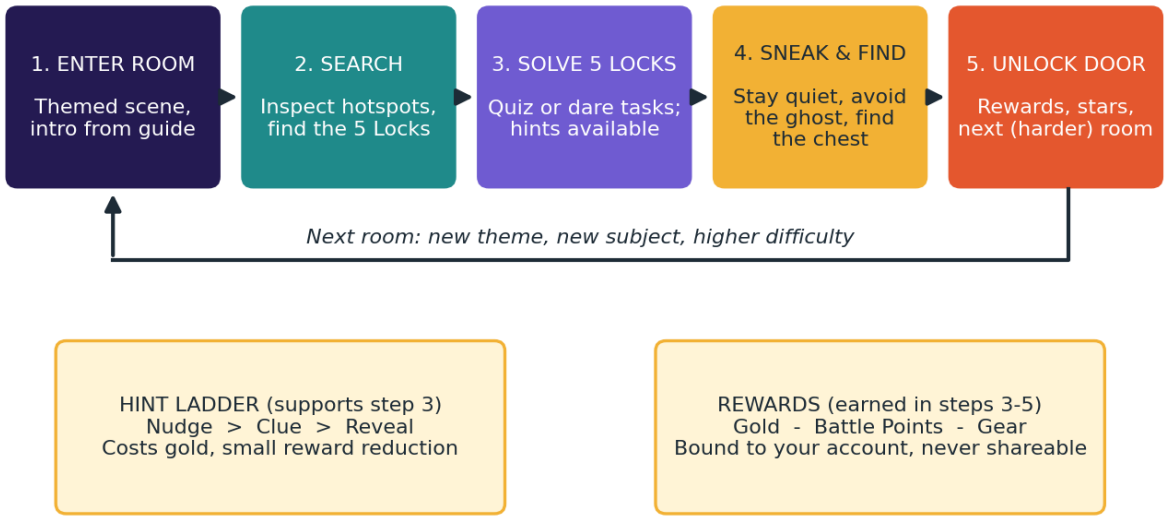

Character	Role and look	Personality and arc	Gameplay function
Grimble, the keyholder	Small green goblin with large ears and a ring of keys.	Mischievous at first, then sympathetic. Starts as a rival who sometimes makes noise on purpose, and becomes an ally.	Adds light challenge: sometimes hides a shard or adds a decoy. Unlike the Hushers, he never chases the player.
The Hushers (room villains)	One per room: a ghost pirate, ghost librarian, jungle shade, clockwork goblin, frost spirit and the Vault Keeper ghost. Pale, floaty and cartoonish, with big eyes and a finger-to-lips "Shh!" pose.	Stern but silly. Each hates noise, has a catchphrase and a funny "Boo!" when it catches the Seeker. They are guardians, not monsters.	The main antagonists. Wake after the five Locks, patrol, listen for noise, and chase the player (see section 4.3).

4. Core Gameplay Mechanics

4.1 Core loop

The core loop is built around one room at a time (Figure 3). The player enters, searches the scene, solves five Locks, uses the clue shards to sneak to the treasure past the Husher, and then moves on. The loop is short, clear and repeatable, so it works as a single class activity or as a quick session at home.

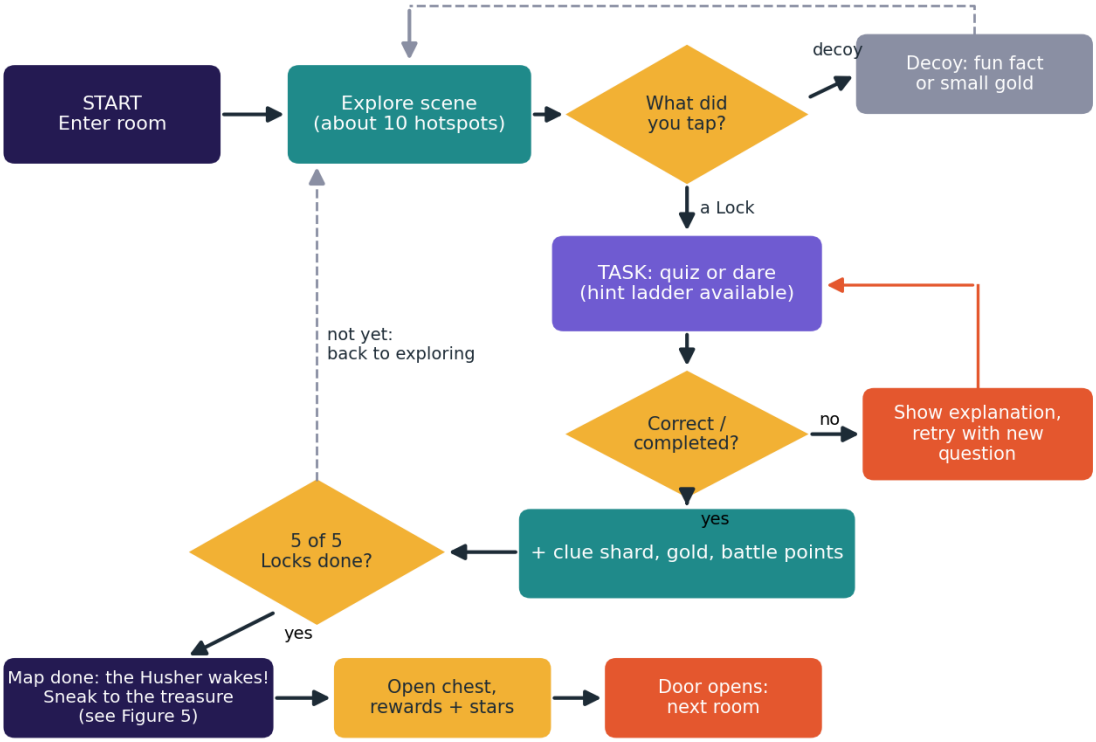

Figure 3 - Core gameplay loop (one room, approx. 10-15 minutes)

4.2 Inside a room

Each room is an illustrated scene with about ten tappable hotspots. Five of them are Locks, and the others are decoys (a fun fact, a small gold coin or an animation). Figure 4 shows exactly what happens when the player taps an object. While the Locks are being solved, the room's Husher is asleep. When all five Locks are solved, the shards combine into a treasure map, the Husher wakes, and the player must quietly reach the correct location to open the chest (section 4.3). The chest rewards the player and opens the door.

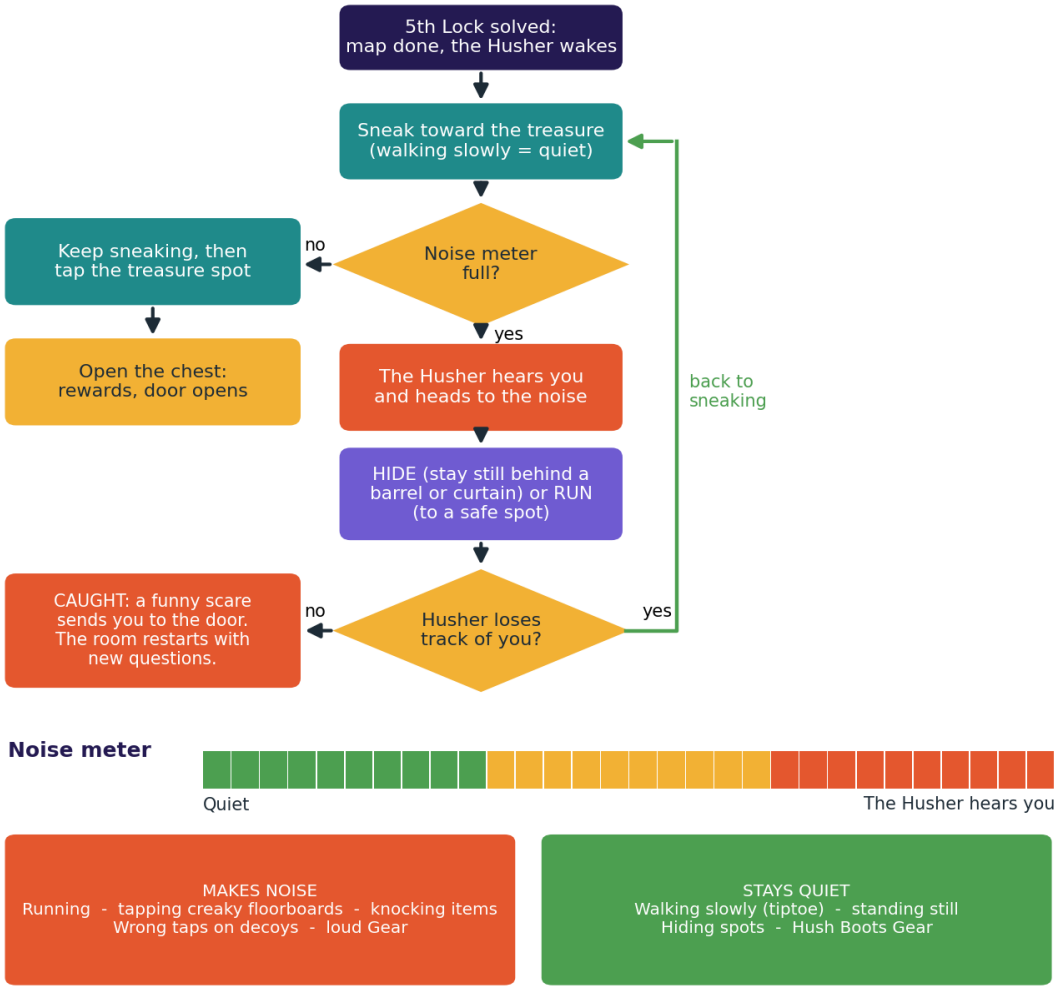

Figure 4 - Flowchart of a single room

4.3 The Husher and the quiet search

Each room's treasure is guarded by a **Husher**, a friendly-scary ghost (or ghost-like goblin) who hates noise. The Husher sleeps while the player solves the five Locks, so the quiz part stays calm and focused on learning. The moment the treasure map is complete, the Husher wakes and patrols the room. The player must now find the chest **quietly**.

Figure 5 - The quiet search: stealth phase flowchart

Noise. The game uses an in-game **noise meter**, not the device microphone. Running, tapping creaky floorboards, knocking over items and wrong taps on decoys raise the meter; walking slowly and standing still lower it. A real microphone would pick up classroom noise, raise child-privacy concerns and exclude deaf or hard-of-hearing players, so the meter is always shown visually with vibration and sound as extra cues.

Hide or run. When the meter fills, the Husher glides toward the noise. The player can **hide** in a marked spot (barrel, curtain, wardrobe) and stay still until the Husher gives up, or **run** toward a safe spot or the room door. If the Husher loses track, the meter resets and the search continues.

Getting caught. If the Husher reaches the player, it does not hurt them. It lets out a silly "Boo!" in a puff of smoke, and the player is scared back to the room's entrance. Following the core rule, **the room restarts**. To keep it fair and not repetitive, the five Locks use a new set of questions from the bank, and gold and Battle Points already earned are kept. In Class Mode and in the assist setting, being caught restarts only the treasure hunt, so solved Locks stay solved. After two catches in a row, Pip offers a free hint that reveals a safe path.

Room	Husher	Hearing range	Speed	Hiding spots
1 Pirate Cove	Ghost pirate	Short; groans before moving	Slow	Many
2 Haunted Library	Ghost librarian	Short	Slow	Many
3 Jungle Temple	Jungle shade	Medium	Medium	Several
4 Clockwork Lab	Clockwork goblin	Medium; ticking warns the player	Medium	Several
5 Frozen Observatory	Frost spirit	Wide	Fast	Fewer
6 The Grand Vault	Vault Keeper ghost	Wide	Fast	Few, some move

Teamwork in Squad mode. The noise meter is shared, so any teammate's noise counts. The team has to decide who moves while the others stay still, which turns the stealth part into a communication challenge. **Gear** such as

Hush Boots (quieter steps) and Pip's Safe Path (shows a hiding spot) give players a way to improve, but never remove the tension.

4.4 Tasks: quizzes and dares

Task type	Examples	Notes
Quiz	Multiple choice, true or false, fill in the blank, match the pairs, order the steps.	Questions come from a bank so each replay differs. Wording and difficulty follow the chosen grade band.
Dare (in-game)	Speed tap, memory pattern, trace a shape, "spot three differences", unscramble a word, "explain it in 10 words" typed answer.	Dares are digital mini-challenges, short (under 30 seconds) and safe. They test attention, memory or creativity as well as knowledge.
Team dare (Squad mode)	Each teammate solves one part of a puzzle and the team combines the answers; or the group agrees on one answer in 30 seconds.	Encourages talking and teamwork. Rewards are still earned individually.
Classroom dare (Class mode, optional)	A teacher-approved prompt such as "say the answer to your neighbour before tapping".	Only available when the teacher turns it on. No photos, recording or physical stunts are ever required.

Completing a Lock. A Lock is complete when the player answers correctly or finishes the dare. A wrong answer shows a short explanation and offers a new question from the bank, so the player learns before moving on. Nobody is permanently blocked. Accuracy and hint use affect the star rating and bonus rewards, not the right to progress.

4.5 Difficulty design

The task brief asks for rising hardness, while the quizzes should stay easy enough for students. VaultQuest does both by making difficulty *relative to the chosen grade band*. A Grade 5 player and a Grade 8 player both start with an easy room, but each sees questions suited to their own level. Inside the band, difficulty rises through several levers at once rather than only harder questions (see Figure 1). The Husher also grows more alert in later rooms (section 4.3).

Room	Subject focus	Question level	Time limit	Free hints	Search complexity
1 Pirate Cove	Maths basics	Recall, 2-3 options	None	5	6 hotspots, 3 decoys
2 Haunted Library	Language	Simple reasoning	Very generous	4	8 hotspots, 4 decoys
3 Jungle Temple	Science	One-step reasoning	Generous	4	10 hotspots, 5 decoys
4 Clockwork Lab	Logic and patterns	Two-step reasoning	Moderate	3	10 hotspots, hidden layers
5 Frozen Observatory	Geography and GK	Mixed difficulty	Moderate	2	12 hotspots, moving items
6 The Grand Vault	Mixed subjects	Challenging within grade	Tighter, optional off	1	12 hotspots, multi-step map

Every time limit can be removed in the accessibility settings, so slower readers are never penalised.

4.6 The hint system

Hints are delivered by Pip in three steps (the hint ladder). They apply both to Locks and to the final treasure search.

Step	What the player gets	Cost	Effect on reward
Nudge	A small push: rereads the question in simpler words, or points at the right area of the room.	Free (uses a daily or room allowance)	None
Clue	Removes two wrong answers, or reveals the first letter, or makes the treasure area glow faintly.	Small amount of gold	Slightly lowers the bonus
Reveal	Shows the answer with an explanation, or marks the treasure spot.	Larger amount of gold	Lowers the star rating for that Lock

Each room gives a set number of free hints (Figure 1, fewer in later rooms). Extra hints cost gold, so gold has a clear use. Players who are stuck for too long (for example after several wrong answers) are offered a free Nudge automatically, which helps learners who need more time.

Figure 6 - Screen mockups (phone layout, concept level)

(a) Room scene (b) Quiz lock with hints (c) Reward screen

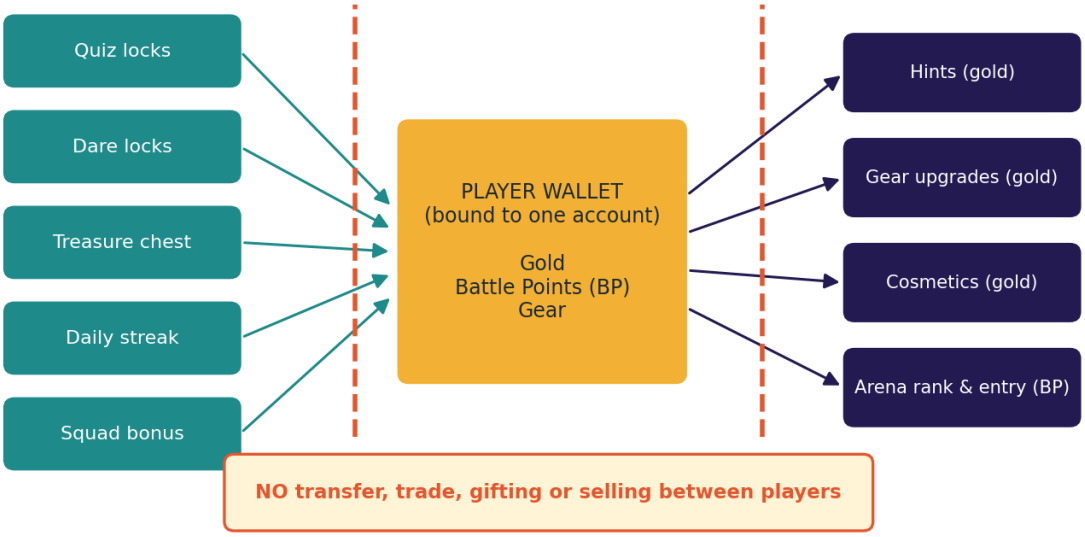

Figure 6 shows the three key screens: the room scene with its HUD (locks counter, noise meter, gold, battle points and the Hint button), a quiz Lock with the hint ladder, and the reward screen.

4.7 Rewards and economy

Reward	How it is earned	What it is used for
Gold	Completing Locks, opening chests, daily streaks, squad bonuses.	Buying hints, upgrading Gear, avatar and room cosmetics.
Battle Points (BP)	Accuracy and speed on Locks; friendly Arena duels.	Arena rank and entry, class leaderboard (if the teacher enables it).
Gear (gaming equipment)	Chest rewards and milestones. Examples: Explorer's Lens (one free treasure hint per room), Time Freeze (pause a timer for 15 seconds), Second Chance (one retry), Hint Scroll.	Gives small help and variety. Gear helps the player progress but never skips learning.

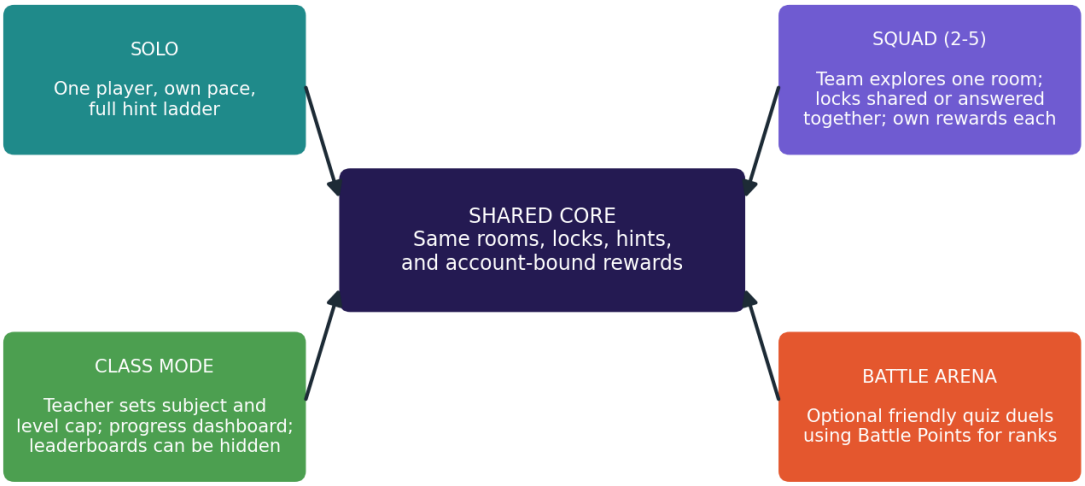

Figure 7 - Reward economy (sources, wallet and sinks)

Non-shareable rewards. All rewards are bound to a single account. There is no trading, gifting, selling or lending, and no way to buy gold with real money. This is a deliberate rule: it prevents cheating and account selling, stops older students from taking items from younger ones, and avoids many child-safety and legal concerns around in-game markets. In Squad mode, teamwork gives each player a bonus multiplier on their *own* rewards rather than pooling items.

4.8 Play modes

Figure 8 - Play modes built on the same rooms

All modes use the same rooms and tasks, so the content team builds each room once. **Solo** suits home play. **Squad** lets friends or classmates share a room: they discuss each Lock, and either divide the Locks or answer together, while each earns rewards individually. **Class Mode** lets a teacher pick a subject set and a difficulty ceiling, see progress, and decide whether leaderboards are visible, since public rankings can discourage some students. The **Battle Arena** is optional: short, friendly quiz duels that use Battle Points for rank.

4.9 Accessibility, safety and inclusion

- Scares are cartoonish: no gore, no loud jump-scare sounds, and the Husher never touches the player. Players can lower scare effects and slow the ghost in settings; the game targets a family-friendly rating.
- The noise meter uses game events only and never the device microphone, and every audio cue has a visual and vibration equivalent.
- Time limits can be switched off; text size, read-aloud for questions and high-contrast mode are built in.

- Colour is never the only signal: hotspots use shapes and animation as well as colour.
- Content filters and no free-text chat. Squad communication uses preset phrases and emojis, or the players' own voice or room.
- Minimal data collection. The product must follow children's privacy rules such as COPPA in the US and India's Digital Personal Data Protection Act, including parental consent where required (to be confirmed with legal advice).
- Question banks are reviewed for age-appropriateness, curriculum fit and cultural inclusiveness.

5. Art, Audio and User Experience

Art. Bright, hand-illustrated 2D scenes with layered depth, clearly readable objects and a unique colour palette per room (golden sands for the cove, deep purples for the library, jungle greens for the temple). Hotspots gently shimmer when the player lingers so the search is fair and not a guessing game. Characters are rounded and friendly, with big readable expressions. The Hushers are pale and glowing with big eyes, designed to be funny first and spooky second.

Audio. Each room has its own short musical theme: sea shanty for the cove, soft harpsichord for the library, drums and flutes for the temple. Sounds reward every action: a lock clicks, shards chime, a chest opens with a fanfare. During the quiet search the music drops to a soft heartbeat and the Husher's whisper changes pitch as it gets closer, with matching on-screen cues. Pip has a small set of voiced reactions that avoid long dialogue.

User experience. One-tap controls, big buttons and a clear progress bar of Locks (for example, "Locks 2/5"). Tutorials are taught through play in Room 1 with Pip's help. Sessions can be saved at any point, so a student can pause and return without losing progress.

6. Market Analysis

6.1 Market context

Game-based learning is a proven, large market. **Kahoot!**, a quiz-game platform launched in 2013, reported 4.4 billion cumulative players since launch and more than six million teachers in its 2020 press kit. **Prodigy Math Game**, a role-playing game for students in grades 1 to 8 where players answer maths questions to earn rewards and battle, reported 150 million registered users in more than 150 countries in 2021 and said one million teachers use it in the United States alone (see References). These figures show that students, teachers and parents already accept games as a learning tool.

Three lessons shape the concept. First, **teachers are the gateway**: both products grew largely through classroom word of mouth, so a Class Mode and teacher tools are essential. Second, **rewards and progression drive repeat play**: Prodigy's reward-and-battle loop keeps students returning, which supports VaultQuest's gold, BP and Gear. Third, **quizzes alone get repetitive**: adding exploration, a hunt and a stealth challenge gives VaultQuest something the quiz platforms do not offer.

> Caveat: these numbers are company-reported (cumulative players or registered accounts, not active users) and are not a forecast for VaultQuest. They show market acceptance of the category, not how many players this game will win.

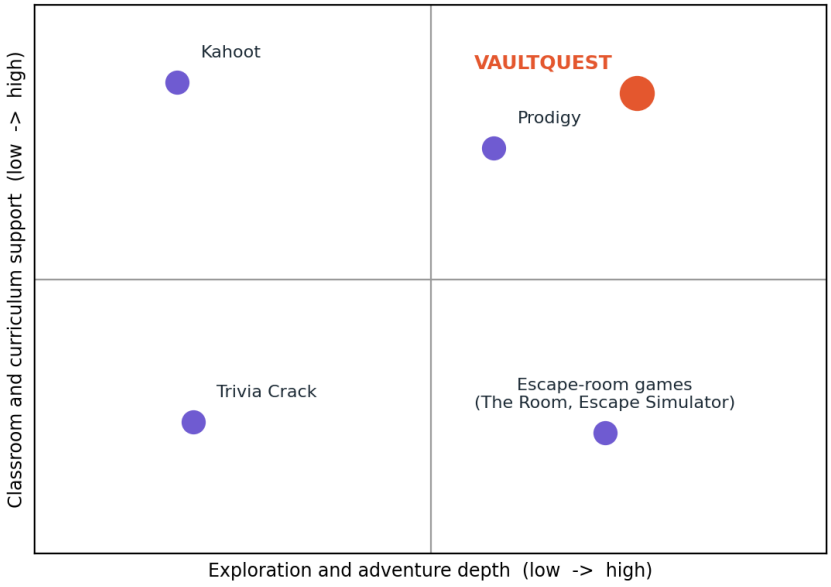

6.2 Target audience

Segment	Profile	What they want	How VaultQuest serves them
Students 9-14 (primary)	Grades 4-9; play on phones, tablets or school computers; like games, short sessions and teamwork.	Fun first, a sense of progress and rewards, and not feeling stupid when stuck.	Treasure hunts, rewards, gentle hints, squad play.
Teachers (secondary)	Primary and middle-school teachers looking for engaging revision and assessment.	Curriculum fit, control of difficulty, progress data, easy setup.	Class Mode, subject and difficulty ceiling, progress dashboard.
Parents (tertiary)	Parents who want safe, useful screen time.	Safety, learning value, no pressure to spend money.	No chat, no trading, no loot boxes, progress summaries.

6.3 Competitive analysis

Game	Core idea	Strengths	Gaps VaultQuest targets	Scale signal
Kahoot!	Live quiz competition run by a teacher	Very easy to start; strong in classrooms	No persistent adventure or exploration; questions only	4.4B cumulative players (2020)
Prodigy Math Game	Maths RPG with battles and rewards	Adaptive, strong rewards and teacher tools	Maths-focused; battle-centred; limited exploration	150M registered users (2021)
Trivia Crack	Mobile trivia with wheel and duels	Fun, social, casual	Not curriculum-based; no teacher tools	Not cited
Escape-room games (The Room, Escape Simulator)	Puzzle rooms where you search and solve	Strong sense of exploration and discovery	Not educational; no classroom support	Not cited

Figure 9 - Positioning map (author's qualitative assessment)

Gap analysis. Quiz platforms are strong in classrooms but weak on adventure and tension; escape-room games are strong on discovery but offer no learning support. VaultQuest aims for the space between: a treasure-hunt adventure that works in class. The closest competitor, Prodigy, already shows that reward and battle loops work, so VaultQuest differentiates through room exploration, the Husher stealth challenge, multi-subject content, dares, the hint ladder and team play.

6.4 SWOT

Strengths	Weaknesses
Clear, easy-to-explain loop. Works solo, in teams and in class. A unique stealth villain adds tension. Hints and rewards give strong replay value.	Needs a large, high-quality question bank. Room art and ghost behaviour need tuning. A new brand with no audience yet.
Opportunities	**Threats**
Schools want engaging digital tools. Regional curricula and languages can be added. Teachers can contribute questions. Seasonal rooms and events.	Established competitors with large user bases. Strict child-privacy rules. Ghost may feel too scary, or restarts too frustrating, for some children.

6.5 Business model and go-to-market

Model. Free for students to play the core rooms. Revenue comes from **school and district licences** (the teacher dashboard, class management, extra subject packs and reports) and optional **cosmetic packs** that never affect learning or progress. There are no loot boxes, no ads aimed at children and no way to buy progress. **Go-to-market.** Run a pilot with a small group of schools to refine difficulty, then launch through teacher communities, school demos and educational events. Short clips of the treasure reveal and the hint ladder are suited to social media for parents and older students.

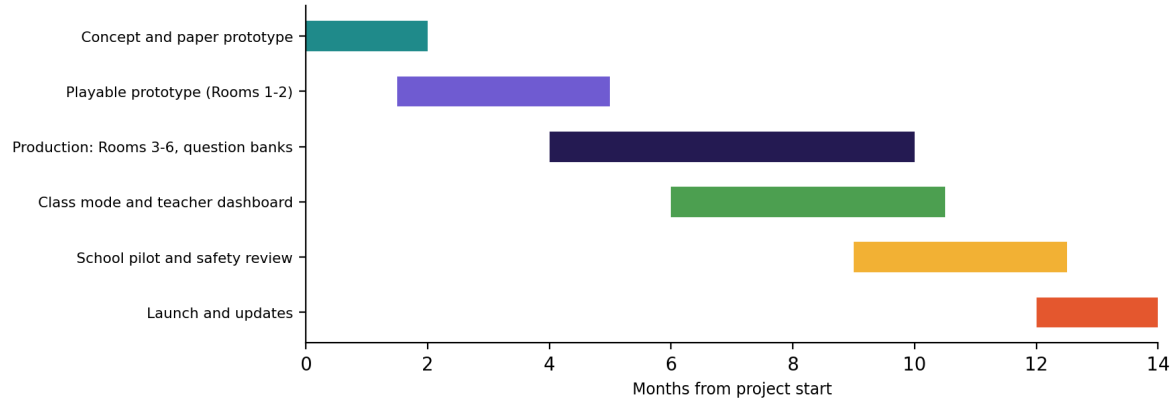

Scenario (illustrative)	Schools	Licence per school per year (assumed)	Annual licence revenue
Conservative	100	approx. USD 300	approx. USD 30,000
Base	500	approx. USD 300	approx. USD 150,000
Optimistic	2,000	approx. USD 300	approx. USD 600,000

Assumed numbers for planning only; actual pricing would be tested in the school pilot. Cosmetic revenue is not included.

7. Production Plan and Risks

The plan assumes a 14-month schedule (Figure 10). A playable prototype of Rooms 1 and 2, including the Husher, is built first to test the loop, the difficulty and the stealth rules. It uses a cross-platform engine (for example Unity or Godot, or an HTML5 framework for web play), a small backend for accounts and progress, and a content tool that lets designers and teachers add questions without code. Suggested core team: game designer, 2 programmers, 2 artists, 1 audio artist (part-time), 1 educational content lead and a producer.

Figure 10 - Indicative 14-month development timeline

Risk	Likelihood	Impact	Mitigation
Question content is costly or low quality	High	High	Curriculum-aligned banks, teacher review, shared content tools, start with core subjects.
Difficulty feels wrong for some grades	Medium	High	Grade bands, adaptive question selection, pilot testing with real classes.
Ghost feels too scary, or restarts feel unfair	Medium	High	Cartoon style, scare settings, assist mode that restarts only the hunt, free safe-path hint after repeated catches, pilot testing with children and teachers.
Tasks become repetitive	Medium	Medium	Varied dare types, themed rooms, random question pools, seasonal rooms.
Child privacy and safety compliance	Medium	High	Minimal data, no open chat, parental consent flows, legal review before pilot.
Low teacher adoption	Medium	High	Easy setup, free tier, teacher feedback in pilot, curriculum tags.

Scope control. If time is short, cut in this order: (1) the Battle Arena, (2) the cosmetic shop, (3) moving hiding spots and extra Husher behaviours, (4) extra dare types. The core loop, five Locks per room, one Husher with hide-or-run stealth, the hint ladder, account-bound rewards and Solo, Squad and Class modes are the non-negotiable core.

8. Conclusion and Next Steps

VaultQuest takes a familiar learning format, the quiz, and gives it a destination: a room to explore, a map to complete, a treasure to find and a ghost to sneak past. The rules are simple (five tasks to open the next door), the difficulty grows fairly, hints keep players moving, and account-bound rewards keep the game safe. Next steps are a paper prototype of one room with real students (including a quiet-search test with a teacher playing the Husher), a clickable mockup of the room and quiz screens, a first set of questions for Rooms 1 and 2, and a short teacher survey to check what they would need.
